By Staff Writer

MobileAccess, a provider of enterprise wireless solutions, has announced that Comcast Center, which was developed and operated by Liberty Property Trust, has deployed its Universal Wireless Network to enable wireless communications throughout Comcast's headquarters.

According to MobileAccess, its Universal Wireless Network ensures indoor coverage for multiple wireless carriers, devices and applications in Comcast Center (CC) and is expected to overcome barriers from the building's exterior glass, which is claimed to impede radio signals and limit wireless coverage within a facility.

In addition, Comcast utilized the MobileAccess network to activate a public and private Wi-Fi network from Cisco.

Cathy Zatloukal, president and CEO of MobileAccess, said: "The MobileAccess Universal Wireless Network delivers a full range of wireless services over an unobtrusive infrastructure that has minimal impact on building resources and is aesthetically pleasing at the same time. The efficiency and flexibility of the solution is why MobileAccess has become the standard for this new generation of advanced, intelligent buildings." M Resort selects Sprint and MobileAccess for wireless technology

The M Resort, Spa and Casino has teamed with Sprint Nextel and MobileAccess to add wide-ranging, wireless technology to its infrastructure. The resort plans to incorporate enhanced communication technology during its construction phase to ensure that guests and employees receive optimum levels of service.

According to Sprint, its Converged Network Solutions (CNS) team will deliver a universal communications system for M Resort, allowing integrated access to wireless voice and data services, mobile phones, BlackBerry devices, PDAs and laptops throughout the resort.

Sprint CNS selected the MobileAccess Universal Wireless Network as its in-building wireless platform for distributing multiple wireless services throughout the M Resort property; both in the front- and back-of-house areas. In addition, the Universal Wireless

Network will provide pervasive coverage for the two-way radios used by fire, police and other first responders, which is an advanced measure used to assist in public safety.

The MobileAccess Universal Wireless Network will serve as the single wireless infrastructure for M Resort, supporting multiple wireless services, applications and devices, despite dense building materials that traditionally impede wireless transmissions in large-scale luxury buildings.

Cathy Zatloukal, CEO of MobileAccess Networks, said: “With the Sprint and MobileAccess solution, M Resort opens its doors with an adaptive, state-of-the-art communications network already in place, ensuring a world-class experience for its guests now and well into the future.”
